## INTRODUCTION

This service manual describes the latest service information for the **IC-RP1220** 1200 MHz FM REPEATER at the time of publication and covers the following versions:

VERSION NO.	VERSION	SYMBOL
#02	U.S.A.	USA
#03	Europe	EUR

## DANGER

**NEVER** connect the repeater to a DC backup battery that uses more than 16 V. This will ruin the repeater.

**DO NOT** expose the repeater to rain, snow or any liquids.

**DO NOT** apply an RF signal of more than 20 dBm (100 mW) to the antenna connector. This could damage the repeater's front end.

## ORDERING PARTS

Be sure to include the following four points when ordering replacement parts:

1. 10-digit order numbers
2. Component part number and name
3. Equipment model name and unit name
4. Quantity required

## REPAIR NOTE

1. Make sure a problem is internal before disassembling the repeater.
2. **DO NOT** open the repeater until the repeater is disconnected from its power source.
3. **DO NOT** force any of the variable components. Turn them slowly and smoothly.
4. **DO NOT** short any circuits or electronic parts. An insulated tuning tool **MUST** be used for all adjustments.
5. **DO NOT** keep power ON for a long time when the repeater is defective.
6. **DO NOT** transmit power into a signal generator or a sweep generator.
7. **ALWAYS** connect a 40 dB~50 dB attenuator between the repeater and a deviation meter or spectrum analyzer when using such test equipment.
8. **READ** the instructions of test equipment thoroughly before connecting equipment to the repeater.

## SECTION 3 CIRCUIT DESCRIPTION

### 3-1 RECEIVER CIRCUITS

#### 3-1-1 RF CIRCUIT (RX UNIT)

Received signals enter the antenna connector (J1) and pass through a bandpass filter circuit (R-FIL and FIL-A UNITS). The filtered signals are applied to an RF amplifier (Q1). The RF amplifier (Q1) employs an FET (MGF1202) which expands the dynamic range with low noise. The RF signals are applied to a dielectric filter (FI1), an RF amplifier (Q3), and a dielectric filter (FI2). The dielectric filters (FI1, FI2) suppress out-of-band signals. The signals are applied to the 1st mixer circuit (Q4).

#### 3-1-2 1st MIXER CIRCUIT (RX UNIT)

The 1st mixer circuit converts the received signals to a fixed frequency of the 1st IF signal with a PLL output frequency.

The signals from the RF circuit are mixed with the 1st LO signal from the PLL circuit to produce a 136.6 MHz 1st IF signal.

#### 3-1-3 1st IF AND 2nd MIXER CIRCUITS (RX UNIT)

After passing through the matching circuit (L1), the 136.6 MHz 1st IF signal is applied to a 1st IF amplifier (Q5) and is then to a bandpass filter (L2~L4, C32~C37) to suppress out-of-band signals. The 1st IF signal is applied to a 2nd mixer circuit (Q6).

The 1st IF signal is mixed with the 2nd LO signal from the 2nd LO oscillator circuit to produce a 17.2 MHz 2nd IF signal. The 17.2 MHz 2nd IF signal is applied to FI3. FI3 is an MCF (Monolithic Crystal Filter) which suppresses out-of-band signals. The 2nd IF signal is amplified at a 2nd IF amplifier (Q8) and is then applied to a 3rd mixer circuit (Q9).

#### 3-1-4 2nd LO OSCILLATOR (RX UNIT)

An overtone oscillator (Q7) generates 39.8 MHz and its harmonic frequency using X1. The signal is applied to a bandpass filter (L8~L10, C48~C53) which selects the 3rd harmonic frequency of 39.8 MHz. The resulting 119.4 MHz 2nd LO signal is applied to the 2nd mixer circuit (Q6).

#### 3-1-5 3rd IF AND DEMODULATOR CIRCUITS (RX UNIT)

The 3rd mixer circuit converts the 2nd IF signal to a 3rd IF signal.

The amplified signal is mixed with a 16.745 MHz 3rd LO signal to produce a 455 kHz 3rd IF signal.

The 455 kHz 3rd IF signal is applied to a ceramic filter (FI4) where unwanted signals are suppressed and then to a limiter amplifier section in pin 5 of IC1.

IC1 contains the local oscillator circuit, limiter amplifier, quadrature detector circuit and active filter circuit. The local oscillator section and X2 generate 16.745 MHz for the 3rd LO signal.

The 3rd IF signal from the limiter amplifier (IC1, pin 5) is applied to the quadrature detector section (IC1, pin 8) and ceramic discriminator X3 to demodulate the 3rd IF signal into an AF signal. The AF signal is output from pin 9 of IC1.

#### 3-1-6 SQUELCH CIRCUIT (RX AND LOGIC UNITS)

A squelch circuit cuts out AF signals when no RF signal is received. By detecting noise components in the AF signals, the squelch circuit switches the AF mute switches.

Some noise components in the AF signal from pin 9 of IC1 are applied to an active filter section (IC1, pin 10) via a de-emphasis circuit (R38, C75~C77). This circuit is an integrated circuit with frequency characteristics of -6 dB/octave. The [SQUELCH] control (R2) on the FRONT PANEL adjusts the input level of pin 10 of IC1.

The active filter section amplifies noise components of frequencies of 20 kHz and above and outputs the resulting signals from pin 11. Output signals are rectified by D5 and are then converted to DC voltage.

When the rectified noise voltage is "HIGH", Q10 turns ON. The collector of Q10 outputs the squelch signal. The signal is applied to pin 16 of IC9 on the LOGIC UNIT through the "SQL-S" signal line.

When the rectified noise voltage is "LOW", Q10 turns OFF. The collector of Q10 outputs the busy signal. The signal is applied to the [BUSY] indicator on the LED UNIT through the "BUSY" signal line. The [BUSY] indicator lights up in green.

### 3-1-7 AF AMPLIFIER CIRCUIT (RX AND AF UNITS)

The AF signal output from pin 9 of IC1 is applied to a monolithic IC (IC2, pin 3) which functions as high-pass and low-pass filters. The filtered signal is output from pin 7 of IC2 and is then applied to the [VOLUME] control (R1) on the FRONT PANEL through an AF mute switch (Q11). When the squelch is closed, Q11 cuts off the AF signal as an AF mute switch. The AF signal is power-amplified at an AF power amplifier (IC1) on the AF UNIT to drive a speaker.

The "MOD" signal from pin 7 of IC7 changes the reactance of varactor diodes (D1~D4) to modulate the oscillated signal at T-VCO (Q1). The oscillated signal is buffer-amplified at Q2.

## 3-2 TRANSMITTER CIRCUITS

### 3-2-1 MICROPHONE AMPLIFIER CIRCUIT (TX AND T-VCO UNITS)

The AF signal from the microphone is applied to a microphone amplifier (Q10). The amplified signal passes through a microphone mute switch (Q11) and is then mixed with the "MOD" signal from IC15 on the LOGIC UNIT. The signal is applied to a limiter (IC7, pin 3) and is then output from pin 1 of IC7.

The output signal is applied to the splatter filter circuit (IC7, R59, R62, R63, C84, C69~C71) which attenuates the components of frequencies of 3 kHz and above. Pin 7 of IC7 outputs a "MOD" signal. The "MOD" signal is applied to the T-VCO UNIT.

### 3-2-2 MODULATION CIRCUIT (T-VCO UNIT)

The modulation circuit modulates the VCO oscillating signal (RF signal) using the microphone audio signal.

### 3-2-3 DOUBLER CIRCUIT (TX UNIT)

The T-VCO output is buffer-amplified at IC1 and then passes through a low-pass filter. The filtered signal is re-amplified at Q2 and is then applied to a doubler circuit (D2, D3). The resulting signal is applied to a bandpass filter (FIL B UNIT) to suppress out-of-band signals. The signal is amplified at Q3 and Q4. The amplified signal is applied to a drive amplifier circuit.

### 3-2-4 DRIVE AMPLIFIER CIRCUIT (PA UNIT)

The drive amplifier (IC1) amplifies the signal to obtain 1 W (30 dBm).

The control voltage from the APC circuit is applied to IC1 (pin 3) for stable RF output power from a power amplifier (IC2).

### 3-2-5 RF POWER AMPLIFIER (PA UNIT)

IC2 is a power module which provides a stable 10 W (DC 13.8 V) of output power.

An RF signal from the drive amplifier (IC1, pin 5) is applied to pin 1 of IC2. The amplified signal is output from pin 5 of IC2 and applied to the RF detector circuit. The detected signal enters the T-FIL UNIT through J2 and is then applied to the antenna connector.

#### • MICROPHONE AMPLIFIER CIRCUIT

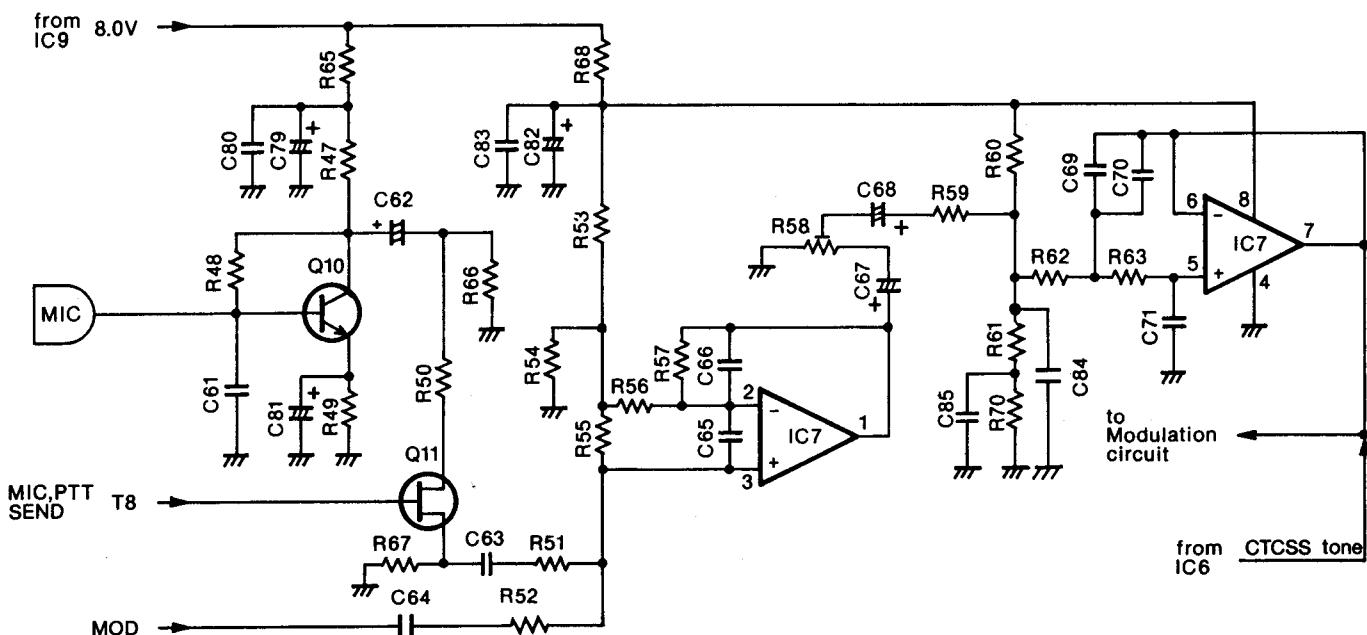

Fig. 2

### 3-2-6 APC CIRCUIT (PA UNIT)

This circuit controls a voltage of the buffer-amplifier (Q4) on the TX UNIT and the driver amplifier (IC1) to obtain stable RF output power.

The output power level from the power module is detected at the APC detector (D1). When the antenna impedance is matched at  $50 \Omega$ , the detected voltage by D1 is at its minimum. The detected voltage is applied to a differential amplifier (IC3, pin 6). The APC reference voltage is applied to pin 5 of IC3.

## 3-3 PLL CIRCUITS

### 3-3-1 GENERAL

Each receiver and transmitter circuit has an independent PLL circuit for controlling frequencies. All PLL circuit are shielded and installed on the RX and TX UNITS.

PLL circuits steadily oscillate the transmit frequency and the receive local frequency. The PLL output frequency is controlled by the divided ratio (N-data) of the programmable divider.

### 3-3-2 RECEIVER PLL CIRCUIT (RX UNIT)

The PLL circuit, using a PLL IC (IC3) and dual modulus prescaler (IC4) on the RX UNIT, generates the 1st LO frequency with a Colpitts VCO (Q1) on the R-VCO UNIT. The PLL IC sets the dividing ratio based on serial data from the CPU and controls the dual modulus prescaler. The PLL IC compares the phases of a VCO signal with the reference oscillator frequency and detects the out-of-step phase. Then, the VCO signal is output from the PLL IC (pins 16 and 17).

When the antenna impedance is mismatched, the voltage in pin 6 of IC3 exceeds the reference voltage in pin 5 of IC3. The output level from pin 7 of IC3 decreases. Q2 amplifies the current from the differential amplifier (IC3) which controls Q1. Q1 changes the supply voltage to IC1 and Q4 on the TX UNIT.

This decreases the output power from the drive amplifier (IC1) and buffer-amplifier (Q4) until the input voltage in pin 6 of IC3 reaches the same level as pin 5 of IC3.

### 3-3-3 RECEIVER REFERENCE OSCILLATOR CIRCUIT (RX AND TX UNITS)

A 12.8 MHz reference frequency is produced by the oscillator (X1) on the TX UNIT. The frequency is adjusted with R31. The reference frequency is buffer-amplified at Q7 and applied to the PLL IC (IC3, pin 2) on the RX UNIT.

### 3-3-4 RECEIVER LOOP FILTER AND DC-DC CONVERTER CIRCUITS (RX AND R-DC-DC UNITS)

Phase-detected signals from IC3 (pins 16 and 17) are converted to DC voltage by a loop filter consisting of an active filter (Q15, Q16).

The frequency at which the VCO oscillates is controlled by varactor diodes (D1~D4) on the R-VCO UNIT. DC voltage (PLL lock voltage) is provided through the integrator circuit (R44, C146).

The DC-DC converter circuit (IC1 and Q1) on the R-DC-DC UNIT creates approximately 20 V DC from 5 V DC to obtain wide range lock voltages for the PLL circuits.

### 3-3-5 RECEIVER VCO CIRCUIT (R-VCO UNIT)

The VCO circuit (Q1, D1~D4) generates the receive frequency. Strip lines are used for stable oscillation over a wide frequency range. Varactor diodes (D1~D4) provide frequency control. The buffer-amplifier (Q2) amplifies VCO oscillation and does not permit the latter circuit to affect the VCO oscillation. The signal is divided by 64 or 65 in the dual modulus prescaler (IC4). The phase-divided signal is output from pin 5 of IC4 and applied to the PLL IC (IC3, pin 6).

### 3-3-6 RECEIVER UNLOCK SENSOR CIRCUIT (RX AND LOGIC UNITS)

When the PLL circuit is unlocked, pin 13 of IC3 becomes "HIGH". The "HIGH" signal is applied to pin 14 of IC9 as an unlock signal on the LOGIC UNIT.

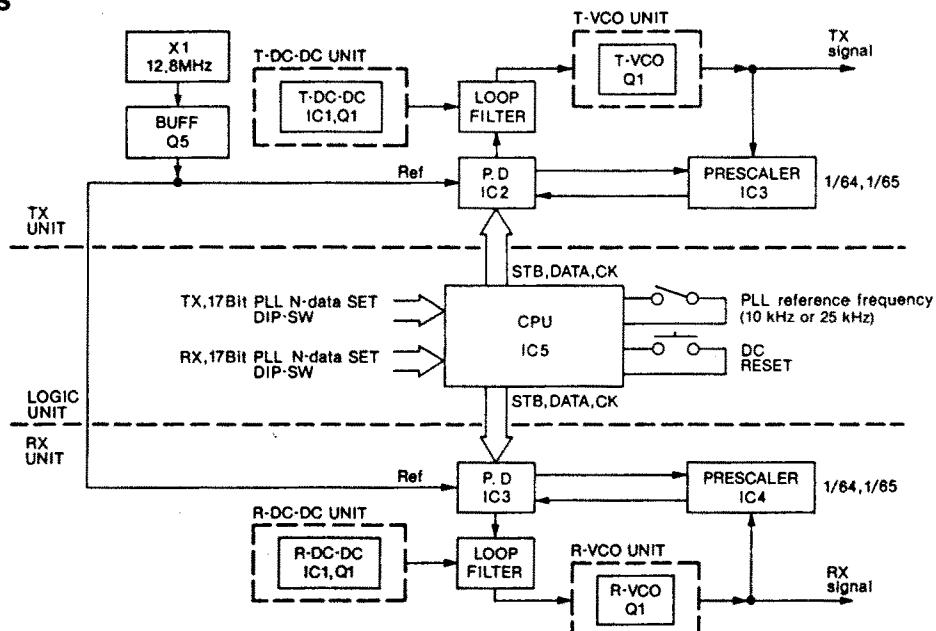

### 3-3-7 DOUBLER CIRCUIT (RX UNIT)

The R-VCO output is buffer-amplified at IC5 and then passes through a low-pass filter. The filtered signal is re-amplified at Q19 and is then applied to a doubler circuit (D7, D8). The resulting signal is applied to a bandpass filter (FIL C UNIT) to suppress out-of-band signals and then to a 1st mixer (Q4) to produce a 136.6 MHz 1st IF signal.

### 3-3-8 TRANSMITTER PLL CIRCUIT (TX UNIT)

The PLL circuit, using a PLL IC (IC2) and dual modulus prescaler (IC3) on the TX UNIT, generates the transmit frequency with a Colpitts VCO (Q1) on the T-VCO UNIT. The PLL IC sets the dividing ratio based on serial data from the CPU and controls the dual modulus prescaler. The PLL IC compares the phases of a VCO signal with the reference oscillator frequency and detects the out-of-step phase. Then, the VCO is output from the PLL IC (IC2, pins 16 and 17).

#### • PLL CIRCUITS

### 3-3-9 TRANSMITTER REFERENCE OSCILLATOR CIRCUIT (TX UNIT)

A 12.8 MHz reference frequency is produced by the oscillator (X1). The frequency is adjusted with R31. The reference frequency is buffer-amplified at Q7 and applied to the PLL IC (IC2, pin 2).

### 3-3-10 TRANSMITTER LOOP FILTER AND DC-DC CONVERTER CIRCUITS (TX AND T-DC-DC UNITS)

Phase-detected signals from IC2 (pins 16 and 17) are converted to DC voltage by a loop filter consisting of an active filter (Q5, Q6).

The frequency at which the VCO oscillates is controlled by varactor diodes (D1~D4) on the T-VCO UNIT. DC voltage (PLL lock voltage) is provided through the integrator circuit (R23, C87).

The DC-DC converter circuit (IC1 and Q1) on the T-DC-DC UNIT creates approximately 20 V DC from 5 V DC to obtain a wide range of lock voltages for the PLL circuits.

### 3-3-11 TRANSMITTER VCO CIRCUIT (T-VCO UNIT)

The VCO circuit (Q1, D1~D4) generates the transmit frequency and produces FM modulation. Strip lines are used for stable oscillation over a wide frequency range. Varactor diodes (D1~D4) provide frequency control. The buffer-amplifier (Q2) amplifies VCO oscillation and does not permit the latter circuit to affect the VCO oscillation. The signal is divided by 64 or 65 in the dual modulus prescaler (IC3). The phase-divided signal is output from IC3 (pin 5) and is applied to the PLL IC (IC2, pin 6).

Fig. 4

### 3-3-12 TRANSCEIVER UNLOCK SENSOR CIRCUIT (TX AND LOGIC UNITS)

When the PLL circuit is unlocked, IC2 (pin 13) becomes "HIGH". The "HIGH" signal is applied to IC9 (pin 15) as an unlock signal on the LOGIC UNIT.

### 3-4 VOLTAGE LINES

LINE	DESCRIPTION
13.8 V	This voltage is generated at REG-A and REG-B UNITS.
5 V	Common 5 V converted from the 13.8 V line at IC9 on the RX UNIT, IC8 on the TX UNIT and IC16 on the LOGIC UNIT. These switching regulators convert the IC1 output level on the R-DC-DC or T-DC-DC UNIT into approximately 20 V DC.
8 V	8 V DC converted from the 13.8 V line at IC8 on the RX or IC9 on the TX UNIT.
T8	Transmit 8 V. When the "MIC, PTT" line is grounded or the "SEND" line becomes "HIGH", Q8 turns ON. The collector voltage (Q9) on the TX UNIT lights up the [TRANSMIT] INDICATOR. This voltage controls the buffer-amplifiers (IC1, Q2, Q3) and then is applied to the differential amplifier (IC3) on the PA UNIT.

### 3-5 REGULATOR CIRCUITS

The DC voltages are supplied from regulator circuits corresponding to the voltages. They are regulated at the following circuits using 13.8 V DC.

#### (1) 5 V REGULATOR

5 V DC are regulated by the following three-terminal voltage regulators.

REGULATOR	IC8	IC9	IC16	IC2
UNIT	TX	RX	LOGIC	REG-A

#### (2) 8 V REGULATOR (RX AND TX UNITS)

8 V DC are regulated by the three-terminal voltage regulators (IC8: RX UNIT and IC9: TX UNIT).

### 3-6 DTMF DECODER CIRCUIT

AF signals from the RX UNIT are applied to Q1 on the LOGIC-A UNIT through J5 and signals are amplified.

IC4 is an IC chip for the DTMF detector. An applied double-tone signal is detected at IC4 and outputs signals as a 4-bit binary code.

#### • DTMF DECODER CIRCUIT

### 3-7 OTHER CIRCUITS

#### 3-7-1 CTCSS DECODER CIRCUIT (RX UNIT)

IC6 contains a CTCSS tone encoder/decoder, an AF amplifier circuit and a two-stage AF filter. The encoder is not used in this circuit.

The AF signal from pin 9 of IC1 is applied to Q17. Q17 is an active filter which functions as a low-pass filter. The filtered signals are applied to a programmable CTCSS tone decoder (IC6, pin 29) which decodes 67.0 Hz ~ 250.3 Hz tone frequencies. The tone frequency is set by the dip switches (S3) on the LOGIC-A UNIT.

The AF signal from IC6 (pin 29) is applied to the AF amplifier circuit and then to the two-stage AF filter. The filtered signal is output as a tone squelch signal from pin 23 of IC6. The tone squelch signal is applied to pin 17 of IC9 on the LOGIC UNIT through the "T-SQL" signal line.

IC7 functions as a serial/parallel converter and supplies 8-bit parallel data to pins 3~6 of IC6. The following table shows the relation between the input data and output frequency from IC6.

3-7-2 CTCSS ENCODER CIRCUIT (TX UNIT)

The CTCSS encoder (IC6) encodes 67.0 Hz~250.3 Hz tone frequencies which are set by the dip switches (S11) on the LOGIC-A UNIT. The tone frequency is output from IC6 (pin 1) and is then applied to R40 for the deviation adjustment.

IC5 functions as a serial/parallel converter and supplies 8-bit parallel data to IC6. The following table shows the relation between the input data and the output frequency from IC6.

## SECTION 6 ADJUSTMENT PROCEDURES

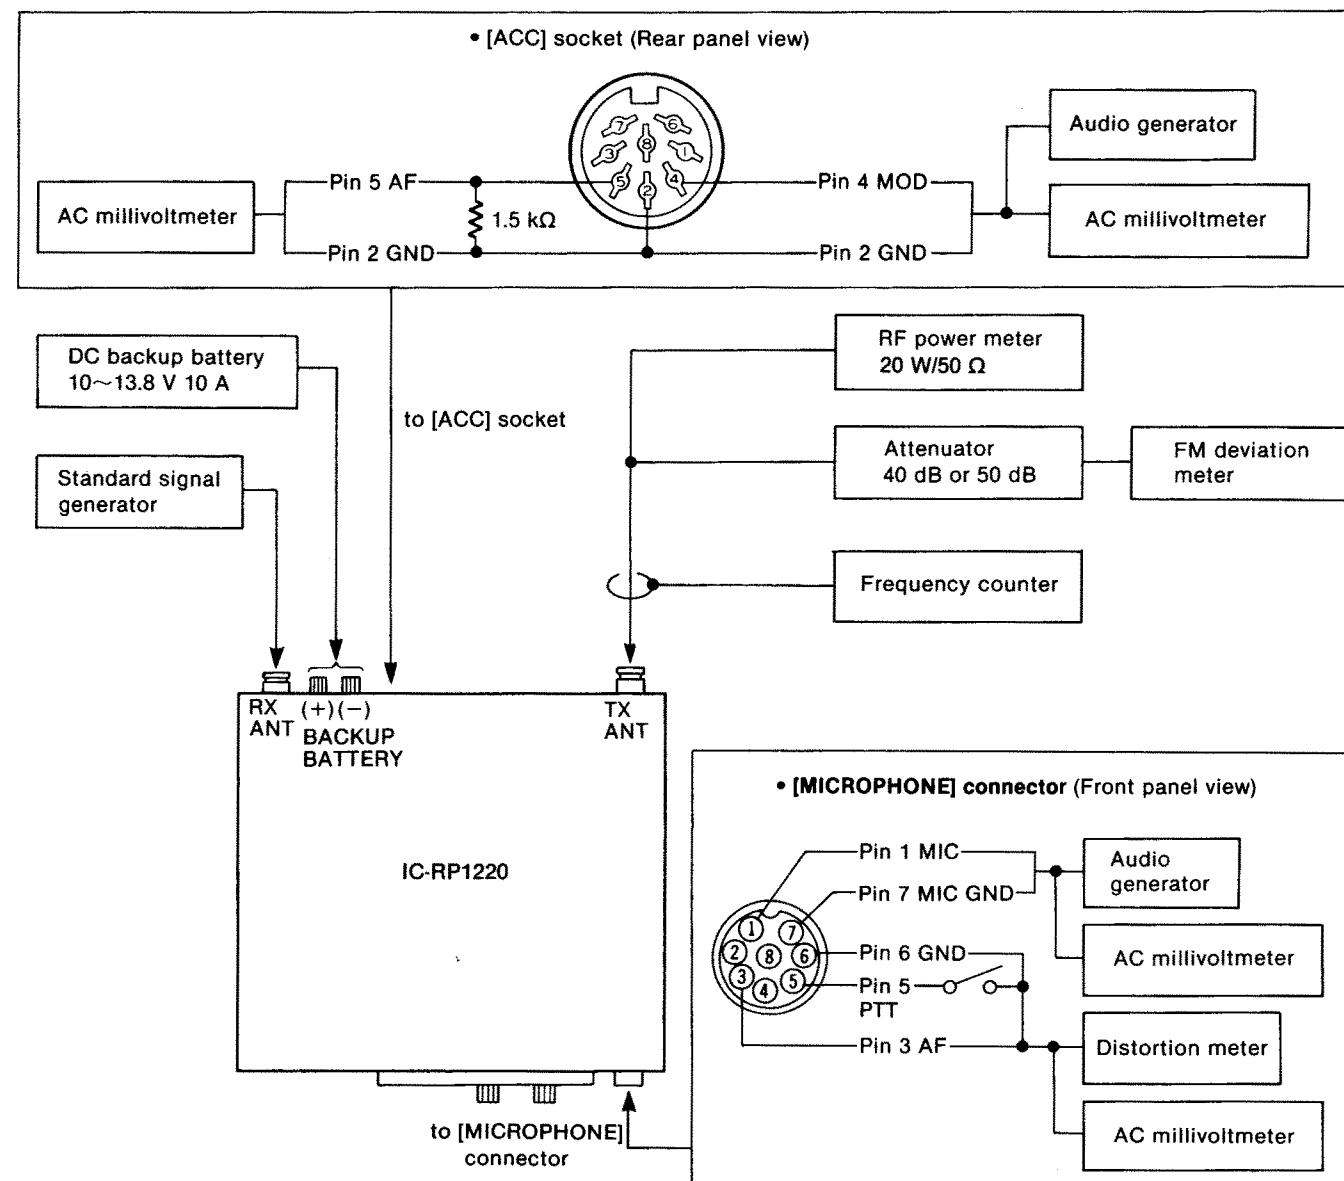

### 6-1 PREPARATION BEFORE SERVICING

#### ■ REQUIRED TEST EQUIPMENT

EQUIPMENT	GRADE AND RANGE	EQUIPMENT	GRADE AND RANGE
DC backup battery	Output voltage : 10~13.8 V DC Current capacity : 10 A or more	AC millivoltmeter	Measuring range : 10 mV~3 V
RF power meter (terminated type)	Measuring range : 1~20 W Frequency range : 1200~1300 MHz Impedance : 50 Ω SWR : Less than 1.2: 1	Audio generator	Frequency range : 300~3000 Hz Output level : 1~300 mV
Frequency counter	Frequency range : 0.1~1300 MHz Frequency accuracy : ±1 ppm or better Sensitivity : 100 mV or better	Attenuator	Power attenuation : 40 or 50 dB Capacity : 60 W or more
Oscilloscope	Frequency range : DC~20 MHz Measuring range : 0.01~10 V	Distortion meter	Frequency range : 1 kHz ±10 Hz Measuring range : 1~20 %
Standard signal generator (SSG)	Frequency range : 0.1~1300 MHz Output level : -127~-17 dBm (0.1 μV~32 mV)	FM deviation meter	Frequency minimum : 1300 MHz Measuring range : 0~±10 kHz
		DC voltmeter	Input impedance : 50 kΩ/DC or better
		RF voltmeter	Frequency range : 0.1~1300 MHz Measuring range : 0.01~10 V

CW: Clockwise CCW: Counterclockwise
